

## Organization of this Guide

I. Configuration Basic model and how it works Syntax - json, \_ %  
%%; defining values; declaring objects Included  
setupcoreservicesidauthlocal/grizzlyAWS/lambdamemory/dynamo  
bootstrap/cloud\_bootstraplocal config Configure Cloud  
Standup (the script uses this to invoke some version of deployer  
over cloudformation) cloud to connect to (AWS is the only  
current option) bucket to store CF instack namecomponents to  
deploy and how to connect to cloud resources, roles etc. custom  
domains to configure Also obviously requires to be done as a  
specific user, but probably on the command line

II. Admin Scripts - aws\_standup and ziniki including all the  
options flas integration --ziniki most obviously, but probably  
other things too. memory admin, dump etc. configuring domains  
into a server adding OpenID & OAuth provider stracing can be  
done with cloudwatch but we should have some additional  
tools in particular catching errors and notifications backups in  
cloud are assumed to be handled by cloud infrastructure  
(glacier, etc) Commerce Admin? Installing new services (not  
including FLAS)? Installing modules

III. APIs DataStore ContentStore Uploader... and more in  
time Commerce Analytics Mail

IV. More technical information Working with self-signed  
certificates ZiWSH/Websockets/Push Notifications OpenID &  
OAuth integration
