

Organization of this Guide

I. Configuration Basic model and how it works Syntax - json, _ %
%%; defining values; declaring objects Included
setupcoreservicesidauthlocal/grizzlyAWS/lambdamemory/dynamo
bootstrap/cloud_bootstraplocal config Configure Cloud
Standup (the script uses this to invoke some version of deployer
over cloudformation) cloud to connect to (AWS is the only
current option) bucket to store CF instack namecomponents to
deploy and how to connect to cloud resources, roles etc. custom
domains to configure Also obviously requires to be done as a
specific user, but probably on the command line

II. Admin Scripts - aws_standup and ziniki including all the
options flas integration --ziniki most obviously, but probably
other things too. memory admin, dump etc. configuring domains
into a server adding OpenID & OAuth provider stracing can be
done with cloudwatch but we should have some additional
tools in particular catching errors and notifications backups in
cloud are assumed to be handled by cloud infrastructure
(glacier, etc) Commerce Admin? Installing new services (not
including FLAS)? Installing modules

III. APIs DataStore ContentStore Uploader... and more in
time Commerce Analytics Mail

IV. More technical information Working with self-signed
certificates ZiWSH/Websockets/Push Notifications OpenID &
OAuth integration
